Intro to Data Science HW 3

```
# Enter your name here: Hrishikesh Telang
```

Attribution statement: (choose only one and delete the rest)

```
# 2. I did this homework with help from the book and the professor and these Internet sources: StackOve
```

Reminders of things to practice from last week:

Make a data frame data.frame( ) Row index of max/min which.max( ) which.min( ) Sort value or order rows sort( ) order( ) Descriptive statistics mean( ) sum( ) max( ) Conditional statement if (condition) "true stuff" else "false stuff"

This Week:

Often, when you get a dataset, it is not in the format you want. You can (and should) use code to refine the dataset to become more useful. As Chapter 6 of Introduction to Data Science mentions, this is called "data munging." In this homework, you will read in a dataset from the web and work on it (in a data frame) to improve its usefulness.

Part 1: Use read_csv( ) to read a CSV file from the web into a data frame:

A. Use R code to read directly from a URL on the web. Store the dataset into a new dataframe, called *dfComps*. The URL is: "https://intro-datascience.s3.us-east-2.amazonaws.com/companies1.csv" **Hint:** use read_csv( ), not read.csv( ). This is from the **tidyverse package**. Check the help to compare them.

```
library(tidyverse)
```

```
## -- Attaching packages --------------------------------------- tidyverse 1.3.1 --

## v ggplot2 3.3.5     v purrr   0.3.4
## v tibble  3.1.4     v dplyr   1.0.7
## v tidyr   1.1.3     v stringr 1.4.0
## v readr   2.0.1     v forcats 0.5.1

## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

```
dfComps <- read_csv("https://intro-datascience.s3.us-east-2.amazonaws.com/companies1.csv")
```

```
## Rows: 47758 Columns: 18

## -- Column specification --------------------------------------------------------
## Delimiter: ","
## chr (16): permalink, name, homepage_url, category_list, market, funding_tota...
## dbl  (2): funding_rounds, founded_year

##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
dfComps
```

```
## # A tibble: 47,758 x 18
##    permalink  name   homepage_url  category_list  market funding_total_u~ status
##    <chr>      <chr>  <chr>         <chr>          <chr>  <chr>            <chr>
##  1 /organiza~ #wayw~ http://www.w~ |Entertainmen~ News   1 750 000        acqui~
##  2 /organiza~ &TV C~ http://enjoy~ |Games|        Games  4 000 000        opera~
##  3 /organiza~ 'Rock~ http://www.r~ |Publishing|E~ Publi~ 40 000           opera~
##  4 /organiza~ (In)T~ http://www.I~ |Electronics|~ Elect~ 1 500 000        opera~
##  5 /organiza~ #NAME? http://plusn~ |Software|     Softw~ 1 200 000        opera~
##  6 /organiza~ -R- R~ <NA>          |Entertainmen~ Games  10 000           opera~

## 10 /organiza~ 004 T~ http://004gm~ |Software|     Softw~ -                opera~
## # ... with 47,748 more rows, and 11 more variables: country_code <chr>,
## #   state_code <chr>, region <chr>, city <chr>, funding_rounds <dbl>,
## #   founded_at <chr>, founded_month <chr>, founded_quarter <chr>,
## #   founded_year <dbl>, first_funding_at <chr>, last_funding_at <chr>
```

Part 2: Create a new data frame that only contains companies with a homepage URL:

B. Use View( ), head( ), and tail( ) to examine the **dfComps** dataframe. **Add a block comment that briefly describes what you see.**

```
View(dfComps)
head(dfComps)
```

```
## # A tibble: 6 x 18
##   permalink  name   homepage_url  category_list   market funding_total_u~ status

## # ... with 11 more variables: country_code <chr>, state_code <chr>,
## #   region <chr>, city <chr>, funding_rounds <dbl>, founded_at <chr>,
## #   founded_month <chr>, founded_quarter <chr>, founded_year <dbl>,
## #   first_funding_at <chr>, last_funding_at <chr>
```

C. Create a variable (called **noURL**) that has a value of **TRUE** if a company is missing a homepage URL. This variable should be a part of **dfComps**, not just a standalone vector.

```
dfComps$noURL <- is.na(dfComps$homepage_url)
dfComps
```

```
## # A tibble: 47,758 x 19
##    permalink  name   homepage_url  category_list  market funding_total_u~ status
##    <chr>      <chr>  <chr>         <chr>          <chr>  <chr>            <chr>
##  1 /organiza~ #wayw~ http://www.w~ |Entertainmen~ News   1 750 000        acqui~
##  2 /organiza~ &TV C~ http://enjoy~ |Games|        Games  4 000 000        opera~
##  3 /organiza~ 'Rock~ http://www.r~ |Publishing|E~ Publi~ 40 000           opera~
##  4 /organiza~ (In)T~ http://www.I~ |Electronics|~ Elect~ 1 500 000        opera~
##  5 /organiza~ #NAME? http://plusn~ |Software|     Softw~ 1 200 000        opera~
##  6 /organiza~ -R- R~ <NA>          |Entertainmen~ Games  10 000           opera~
##  7 /organiza~ .Club~ http://nic.c~ |Software|     Softw~ 7 000 000        <NA>
##  8 /organiza~ .Fox ~ http://www.d~ |Advertising|  Adver~ 4 912 393        closed
##  9 /organiza~ 0-6.c~ http://www.0~ |Curated Web|  Curat~ 2 000 000        opera~
## 10 /organiza~ 004 T~ http://004gm~ |Software|     Softw~ -                opera~
## # ... with 47,748 more rows, and 12 more variables: country_code <chr>,
## #   state_code <chr>, region <chr>, city <chr>, funding_rounds <dbl>,
## #   founded_at <chr>, founded_month <chr>, founded_quarter <chr>,
## #   founded_year <dbl>, first_funding_at <chr>, last_funding_at <chr>,
## #   noURL <lgl>
```

D. Use the table( ) command to summarize the contents of **noURL**. **Write a comment interpreting what you see – how many companies are missing a homepage URL?**

```
table(dfComps$noURL)
```

```
##
## FALSE  TRUE
## 44435  3323
```

E. Use **subsetting** to create a new dataframe that contains only the companies with homepage URLs (store that dataframe in **urlComps**).

```
urlComps <- subset(dfComps, dfComps$noURL == FALSE)
urlComps
```

```
## # A tibble: 44,435 x 19
##    permalink  name   homepage_url  category_list  market funding_total_u~ status
##    <chr>      <chr>  <chr>         <chr>          <chr>  <chr>            <chr>
##  1 /organiza~ #wayw~ http://www.w~ |Entertainmen~ News   1 750 000        acqui~
##  2 /organiza~ &TV C~ http://enjoy~ |Games|        Games  4 000 000        opera~
##  3 /organiza~ 'Rock~ http://www.r~ |Publishing|E~ Publi~ 40 000           opera~
##  4 /organiza~ (In)T~ http://www.I~ |Electronics|~ Elect~ 1 500 000        opera~
##  5 /organiza~ #NAME? http://plusn~ |Software|     Softw~ 1 200 000        opera~
##  6 /organiza~ .Club~ http://nic.c~ |Software|     Softw~ 7 000 000        <NA>
##  7 /organiza~ .Fox ~ http://www.d~ |Advertising|  Adver~ 4 912 393        closed
##  8 /organiza~ 0-6.c~ http://www.0~ |Curated Web|  Curat~ 2 000 000        opera~
##  9 /organiza~ 004 T~ http://004gm~ |Software|     Softw~ -                opera~
## 10 /organiza~ 01Gam~ http://www.0~ |Games|        Games  41 250           opera~
## # ... with 44,425 more rows, and 12 more variables: country_code <chr>,
## #   state_code <chr>, region <chr>, city <chr>, funding_rounds <dbl>,
## #   founded_at <chr>, founded_month <chr>, founded_quarter <chr>,
## #   founded_year <dbl>, first_funding_at <chr>, last_funding_at <chr>,
## #   noURL <lgl>
```

F. Use the dim() command on **urlComps** to confirm that the data frame contains **44,435** observations and **19** columns/variables.

```
dim(urlComps)
```

```
## [1] 44435    19
```

Part 3: Analyze the numeric variables in the dataframe.

G. How many **numeric variables** does the dataframe have? You can figure that out by looking at the output of **str(urlComps)**.

```
str(urlComps)
```

```
## tibble [44,435 x 19] (S3: tbl_df/tbl/data.frame)
##  $ permalink        : chr [1:44435] "/organization/waywire" "/organization/tv-communications" "/organ
##  $ name             : chr [1:44435] "#waywire" "&TV Communications" "'Rock' Your Paper" "(In)Touch Ne
##  $ homepage_url     : chr [1:44435] "http://www.waywire.com" "http://enjoyandtv.com" "http://www.rock
##  $ category_list    : chr [1:44435] "|Entertainment|Politics|Social Media|News|" "|Games|" "|Publishi
##  $ market           : chr [1:44435] "News" "Games" "Publishing" "Electronics" ...
##  $ funding_total_usd: chr [1:44435] "1 750 000" "4 000 000" "40 000" "1 500 000" ...
##  $ status           : chr [1:44435] "acquired" "operating" "operating" "operating" ...
##  $ country_code     : chr [1:44435] "USA" "USA" "EST" "GBR" ...
##  $ state_code       : chr [1:44435] "NY" "CA" NA NA ...
##  $ region           : chr [1:44435] "New York City" "Los Angeles" "Tallinn" "London" ...
##  $ city             : chr [1:44435] "New York" "Los Angeles" "Tallinn" "London" ...
##  $ funding_rounds   : num [1:44435] 1 2 1 1 2 1 1 1 1 1 ...
##  $ founded_at       : chr [1:44435] "1/6/12" NA "26/10/2012" "1/4/11" ...
```

```
##  $ founded_month    : chr [1:44435] "2012-06" NA "2012-10" "2011-04" ...
##  $ founded_quarter  : chr [1:44435] "2012-Q2" NA "2012-Q4" "2011-Q2" ...
##  $ founded_year     : num [1:44435] 2012 NA 2012 2011 2012 ...
##  $ first_funding_at : chr [1:44435] "30/06/2012" "4/6/10" "9/8/12" "1/4/11" ...
##  $ last_funding_at  : chr [1:44435] "30/06/2012" "23/09/2010" "9/8/12" "1/4/11" ...
##  $ noURL            : logi [1:44435] FALSE FALSE FALSE FALSE FALSE FALSE ...
```

H. What is the average number of funding rounds for the companies in **urlComps**?

```
mean(urlComps$funding_rounds)
```

```
## [1] 1.725194
```

I. What year was the oldest company in the dataframe founded? **Hint:** If you get a value of "NA," most likely there are missing values in this variable which preclude R from properly calculating the min & max values. Instead of running, for example, mean(urlComps$founded_year), something like this will work for determining the average:

```
mean(urlComps$founded_year, na.rm=TRUE)
```

```
## [1] 2007.289
```

```
Error in mean(urlComps$founded_year, na.rm = TRUE): object 'urlComps' not found
Traceback:
```

```
1. mean(urlComps$founded_year, na.rm = TRUE)
```

Now write the code to get the oldest company

```
min(urlComps$founded_year, na.rm=TRUE)
```

```
## [1] 1900
```

J. Create another dataframe containing the companies that do not have homepage URLs. Find out the mean number of funding rounds for those companies. Compare that to the answer you recorded for problem H.

```
a <- subset(dfComps, dfComps$noURL == TRUE)
mean(a$funding_rounds)
```

```
## [1] 1.198917
```

Part 4: Use string operations to clean the data.

K. The **permalink variable** in **urlComps** contains the name of each company but the names are currently preceded by the prefix "/organization/". We can use gsub() or str_replace (from tidyverse) to clean the values of this variable:

```
urlComps$company <- gsub("/organization/", "", urlComps$permalink)

library(tidyverse)
#write the code to do the same cleanup, but with str_replace from tidyverse
urlComps$company <- str_replace(urlComps$permalink, "/organization/", "")
urlComps
```

```
## # A tibble: 44,435 x 20
##    permalink  name   homepage_url  category_list  market funding_total_u~ status
##    <chr>      <chr>  <chr>         <chr>          <chr>  <chr>            <chr>
##  1 /organiza~ #wayw~ http://www.w~ |Entertainmen~ News   1 750 000        acqui~
##  2 /organiza~ &TV C~ http://enjoy~ |Games|        Games  4 000 000        opera~
##  3 /organiza~ 'Rock~ http://www.r~ |Publishing|E~ Publi~ 40 000           opera~
##  4 /organiza~ (In)T~ http://www.I~ |Electronics|~ Elect~ 1 500 000        opera~
##  5 /organiza~ #NAME? http://plusn~ |Software|     Softw~ 1 200 000        opera~
##  6 /organiza~ .Club~ http://nic.c~ |Software|     Softw~ 7 000 000        <NA>
##  7 /organiza~ .Fox ~ http://www.d~ |Advertising|  Adver~ 4 912 393        closed

## 10 /organiza~ 01Gam~ http://www.0~ |Games|        Games  41 250           opera~
## # ... with 44,425 more rows, and 13 more variables: country_code <chr>,
## #   state_code <chr>, region <chr>, city <chr>, funding_rounds <dbl>,
## #   founded_at <chr>, founded_month <chr>, founded_quarter <chr>,
## #   founded_year <dbl>, first_funding_at <chr>, last_funding_at <chr>,
## #   noURL <lgl>, company <chr>
```

L. Can you identify another variable which should be numeric but is currently coded as character? Use the as.numeric() function to add a new variable to **urlComps** which contains the values from the char variable as numbers. Do you notice anything about the number of NA values in this new column compared to the original "char" one?

```
str(urlComps)
```

```
## tibble [44,435 x 20] (S3: tbl_df/tbl/data.frame)
##  $ permalink        : chr [1:44435] "/organization/waywire" "/organization/tv-communications" "/orga
##  $ name             : chr [1:44435] "#waywire" "&TV Communications" "'Rock' Your Paper" "(In)Touch N
##  $ homepage_url     : chr [1:44435] "http://www.waywire.com" "http://enjoyandtv.com" "http://www.roc
##  $ category_list    : chr [1:44435] "|Entertainment|Politics|Social Media|News|" "|Games|" "|Publish
##  $ market           : chr [1:44435] "News" "Games" "Publishing" "Electronics" ...
##  $ funding_total_usd: chr [1:44435] "1 750 000" "4 000 000" "40 000" "1 500 000" ...
##  $ status           : chr [1:44435] "acquired" "operating" "operating" "operating" ...
##  $ country_code     : chr [1:44435] "USA" "USA" "EST" "GBR" ...
##  $ state_code       : chr [1:44435] "NY" "CA" NA NA ...
##  $ region           : chr [1:44435] "New York City" "Los Angeles" "Tallinn" "London" ...
##  $ city             : chr [1:44435] "New York" "Los Angeles" "Tallinn" "London" ...
##  $ funding_rounds   : num [1:44435] 1 2 1 1 2 1 1 1 1 1 ...
##  $ founded_at       : chr [1:44435] "1/6/12" NA "26/10/2012" "1/4/11" ...
##  $ founded_month    : chr [1:44435] "2012-06" NA "2012-10" "2011-04" ...
##  $ founded_quarter  : chr [1:44435] "2012-Q2" NA "2012-Q4" "2011-Q2" ...
##  $ founded_year     : num [1:44435] 2012 NA 2012 2011 2012 ...
##  $ first_funding_at : chr [1:44435] "30/06/2012" "4/6/10" "9/8/12" "1/4/11" ...
##  $ last_funding_at  : chr [1:44435] "30/06/2012" "23/09/2010" "9/8/12" "1/4/11" ...
```

```
##  $ noURL            : logi [1:44435] FALSE FALSE FALSE FALSE FALSE FALSE ...
##  $ company          : chr [1:44435] "waywire" "tv-communications" "rock-your-paper" "in-touch-networl
```

```
#Yes, it is funding_total_usd. This column should be numeric
urlComps$funding_total_usd_int <- as.numeric(urlComps$funding_total_usd)
```

```
## Warning: NAs introduced by coercion
```

```
View(urlComps)
#Yes, I can observe that the whole urlComps column is empty and contains NA values
```

M. To ensure the char values are converted correctly, we first need to remove the spaces between the digits in the variable. Check if this works:

```
library(stringi)
urlComps$funding_new <- stri_replace_all_charclass(urlComps$funding_total_usd,"\\p{WHITE_SPACE}", "")
urlComps
```

```
## # A tibble: 44,435 x 22
##    permalink  name   homepage_url  category_list  market funding_total_u~ status
##    <chr>      <chr>  <chr>         <chr>          <chr>  <chr>            <chr>

## # ... with 44,425 more rows, and 15 more variables: country_code <chr>,
## #   state_code <chr>, region <chr>, city <chr>, funding_rounds <dbl>,
## #   founded_at <chr>, founded_month <chr>, founded_quarter <chr>,
## #   founded_year <dbl>, first_funding_at <chr>, last_funding_at <chr>,
## #   noURL <lgl>, company <chr>, funding_total_usd_int <dbl>, funding_new <chr>
```

N. You are now ready to convert **urlComps$funding_new** to numeric using as.numeric() again. Calculate the average funding amount for **urlComps**. If you get "NA," try using the **na.rm=TRUE** argument from problem I.

```
urlComps$funding_new <- as.numeric(urlComps$funding_new)
```

```
## Warning: NAs introduced by coercion
```

```
mean(urlComps$funding_new, na.rm=TRUE)
```

```
## [1] 18321551
```

Part 5: Create a function to automate the process from L-N:

O. The following function should work most of the time. Make sure to run this code before trying to test it. That is how you make the new function known to R. **Add comments to each line explaining what it does:**

```
library(stringi)
#The following function 'convertCharToNum' is initialized as a function with a single parameter named '
convertCharToNum <- function(char_string) {
  #This command removes white spaces
  step1 <- stri_replace_all_charclass(char_string,"\\p{WHITE_SPACE}", "")
  #This coverts the type as numeric
  step2 <- as.numeric(step1)
  #The number is returned
  return(step2)
}
```

P. Run your new function on the **funding_total_usd** variable in **urlComps**:

```
convertCharToNum(urlComps$funding_total_usd)[1:50]
```

```
## Warning in convertCharToNum(urlComps$funding_total_usd): NAs introduced by
## coercion
```

```
##  [1]  1750000  4000000    40000  1500000  1200000  7000000  4912393  2000000
##  [9]       NA    41250 10600000    40000       NA  1750000  2050000    40000
## [17]   500000       NA  2535000  4962651  4059079 10000000  3000000  3000000
## [25]  1250000 35000000    50000  1600000   100000       NA  3000000    77500
## [33]       NA 20000000  1800000       NA       NA   270000   794000   650267
## [41]       NA       NA   378812   130636   619494       NA 66450000       NA
## [49]   700000  5500000
```

Q. Create a new function, that does the same functionality as 'convertCharToNum', but uses tidyverse stringr commands

```
library(tidyverse)
convertCharToNumNew <- function(char_string) {
  #put your code here
  step1 <- str_replace_all(char_string,"\\p{WHITE_SPACE}", "")
  step2 <- as.numeric(step1)
  #make sure there is a return statement
  return(step2)
}
```

```
#test the new function
convertCharToNumNew(urlComps$funding_total_usd)[1:50]
```

```
## Warning in convertCharToNumNew(urlComps$funding_total_usd): NAs introduced by
## coercion
```

```
##  [1]  1750000  4000000    40000  1500000  1200000  7000000  4912393  2000000
##  [9]       NA    41250 10600000    40000       NA  1750000  2050000    40000
## [17]   500000       NA  2535000  4962651  4059079 10000000  3000000  3000000
## [25]  1250000 35000000    50000  1600000   100000       NA  3000000    77500
## [33]       NA 20000000  1800000       NA       NA   270000   794000   650267
## [41]       NA       NA   378812   130636   619494       NA 66450000       NA
## [49]   700000  5500000
```

R. Assign the result of P to a variable in the dataframe:

```
urlComps$funding_total_usd_func1 <- convertCharToNum(urlComps$funding_total_usd)
```

```
## Warning in convertCharToNum(urlComps$funding_total_usd): NAs introduced by
## coercion
```

```
urlComps
```

```

```

S. Calculate the average of this new variable (you may need to use the rm.na=TRUE argument again). Is it the same as the value you got in N? Explain.

```
mean(urlComps$funding_total_usd_func1, na.rm=TRUE)
```

```
## [1] 18321551
```

```
#Yes this is the same value I got in N
```
